CUSTOMER SUCCESS

SAP Integration

A multinational oil field service organization is using Appian’s easy integration capabilities for a more flexible and future-proof alternative for their supply chain needs during these uncertain times.

The organization’s previous solution was difficult to change and maintain, and required coordinators and field personnel to re-key data into multiple systems. Appian quickly and painlessly unified the organization’s SAP and related systems.

The change to a more streamlined system allows them to automatically keep project and job data in sync and increases the efficiency of the job planning and delivery process, enabling personnel to process more jobs in less time without sacrificing quality.

Operational Excellence in Asset Management

Organizations are looking to better monitor their assets in real time and improve enterprise-wide visibility across high priority assets including equipment, machinery, vehicles, and refineries.

Discover how Appian is transforming asset management with enhanced capabilities:

• Intelligent 360° view of assets
• Provide asset tracking and reporting of critical information to stakeholders
• Enable your front-line workforce
• Coordinate field resources and tools
• Extend and connect to existing systems

USE CASE

Fleet Management

Fleet managers today must ensure safety while operating productively and efficiently, complying with regulations, and maintaining lower costs. This proves challenging when organizations are dealing with outdated processes and systems for supply chain operations.

Appian eliminates the need for manual processes and spreadsheet tracking. With Appian, fleet managers have a unified, end-to-end view of operations, improving their decision-making capabilities, strengthening compliance, and maximizing efficiency.

THOUGHT LEADERSHIP

Authorization for Expenditure Transformation

It is crucial for organizations to collaborate with their supply chain operations to develop compliant and cost-effective solutions. Unfortunately, Appian’s low-code platform can help provide better defense in the Authorization for Expenditure (AFE) process.

The AFE process at many oil and gas organizations is inefficient and ineffective at controlling costs. Current processes contribute to the inefficiencies by leading to the misallocation of financial resources and the misalignment of financial objectives. By aligning execution and performance, Appian can help streamline the process and reduce operational costs, improving financial discipline and performance.

Learn more about new technologies in the AFE process in this whitepaper:

The Future of Supply Chain Orchestration

In the wake of COVID-19, the oil and gas industry has had to re-evaluate how their supply chain operations work, with a particular focus on the need for greater integration among disparate systems for greater visibility.

By improving data collection and analysis, Appian is helping oil and gas companies streamline their supply chain operations, reducing costs, and increasing profitability.
